Regularization

- What happens if the regularization term lambda is a negative value?
- What's the most accurate way to estimate lambda function

L1 and Lasso

- Will L1 be effective or useful for datasets with very few features?
- You mentioned in Week 1 that all features are important for a model, hence you advice against removing variables. Is L1 a method you see yourself using as a data scientist?

L2/Ridge Regularization

- How do I determine which one works best for my model, L1 or L2. When selecting a method to reduce overfitting (I believe the next topic answered this, but that was the question I had when watching the video)

L2 and No Sparcity

- I love how L1 and L2 gives the user the option of how to prevent overfitting based on how important feature selection is to them.
