- **Introduction to Missing Data**
    - Is there a set ratio of missing data to total records to determine when to delete a feature that has mostly missing data ? Is it 70%, 80%, 90%, 95% ?

- **Missing Data Patterns**
    - What are the algorithm tests to use to identify Missing data patterns like MCAR, MAR, and NAR patterns when performing Exploratory Data Analysis on a dataset.
- **Demonstration of Missing Data Patterns**
    - When looking for patterns of features with missing data, can I optimize my search based on the highly correlated columns related to our specific feature ?

- **Imputation of Missing Data**
    - For categorical features with missing data, do we name the missing data as a new value like ‘N/A’, or replace them with the mode? I keep getting conflicting answers to them.

- **Domain Knowledge**
    - Each area has its own specialty, which can be learnt on the project. Those insights can be used when deciding imputation techniques for making educated guesses for the data.
